

# PredictSport

## Design Brief & Product Overview

---

**Project:** PredictSport — Social Sports Prediction Platform

**Audience:** Friend groups (~12 users), Wexford FC supporters

**Platform:** Mobile-first web app (WhatsApp link entry point)

**Stack:** Next.js (TypeScript, Tailwind) + Supabase + Vercel

**Status:** Prototype Testing — schema, auth, providers, MVP pages done

**Date:** May 2026

*This document covers the product vision, user experience, design direction, colour palette, typography, component patterns, and key interaction flows. It is intended to give a designer everything needed to create production-ready mockups and a design system for PredictSport.*

12. Technical Constraints

# 1. Product Overview & Vision

PredictSport digitises a paper prediction sheet used by Wexford FC supporters. It's a social sports prediction quiz for friend groups — bragging rights only, no betting. Admin builds competitions with rounds of mixed-sport events. Participants predict outcomes, earn points, and compete on leaderboards.

## Core Principles

- **Reduce admin friction** — Running a competition should be nearly zero-effort. Auto-fetch results from sports APIs, one-click confirm.
- **Support multiple groups** — Different friend groups, clubs, or workplaces each run independent competitions. A user can be in multiple competitions.
- **Full prediction type system** — 6 prediction types from day one (winner, top N, H2H, margin, over/under, beat the handicap). Core product differentiation.
- **Engaging leaderboard** — This is where the fun lives. Streaks, rivalry callouts, form guides, fun facts. Make it worth checking daily.
- **WhatsApp-native feel** — Users arrive via WhatsApp link. The transition should be seamless. Design should feel familiar, not jarring.

## 2. Target Users & Entry Point

Primary users are a group of ~12 friends who are Wexford FC supporters. They currently use a paper prediction sheet passed around at matches. The app replaces this with a digital version they access via WhatsApp links.

### User Journey

- **1. WhatsApp message** — Admin shares competition invite link in the group chat
- **2. Tap link** — Opens PredictSport in mobile browser (no app install)
- **3. Google sign-in** — One tap, auto-joined to the competition
- **4. Make predictions** — Browse events, tap to pick, done
- **5. Get notified** — WhatsApp messages for results, reminders, leaderboard updates
- **6. Check leaderboard** — See where you stand, who's on a streak, banter fuel

### Key Insight

*The transition from WhatsApp to the app must be seamless. Users will tap a link in a WhatsApp group chat and land in the app. The visual transition should be gentle — not jarring. The app should feel like a natural extension of the conversation, not a completely different world.*

## 3. Key Pages & User Flows

### Page 1: My Predictions (Home)

- List of all events in the active competition round
- User's predictions inline — editable if not yet locked
- Colour coding: correct (green), wrong (red), partial (amber), pending (grey)
- Lock countdown timer for each event
- Community prediction split (donut chart showing what the group picked)
- Fun fact / persona callout per event (see Section 9)
- Filter by sport, status, date

### Page 2: Leaderboard

- Podium display for top 3 (gradient cards with avatar, points, form, fun fact)
- Table for remaining participants with accuracy rings, form badges, movement indicators
- Rivalry/race callout banner (e.g. 'Ger trails Davo by just 3 points')
- Expandable rows to see each person's predictions vs correct answers
- Streaks, momentum indicators, 'best in class' awards per sport
- Competition selector if user is in multiple competitions

### Page 3: Admin Panel

- Add/edit events — search by team, competition, date across all sport providers
- Enter or confirm results (one-click confirm for API-fetched results)
- Review event nominations (approve/reject)
- Manage participants, co-admins, roles
- Invite link management (shareable tokenised URLs)
- Scoring rule configuration (at competition creation)
- Deep customisation (persona callouts, etc.) — accessible but not prominent

## 4. Design Direction & Mood

The design should blend three moods that emerged from 7 concept explorations:

- ◆ **Arena (Concept 5)** — Dark theme energy, data visualisation, gamification. Progress bars, accuracy rings, form badges (W/L/P), achievement unlocks, streaks. The competitive, data-rich layer.
- ◆ **Terrace (Concept 6)** — Warmth, personality, community. Pub quiz language, personalised callouts ('The Gaffer Says...'), Irish humour, fun facts prominently displayed. The soul and character layer.
- ◆ **Stadium (Concept 7)** — Clean modern app UI, gradient accents, glassmorphism, well-structured cards, sport-coded colour bars, podium layouts. The polish and usability layer.

### Design Priorities

- **Mobile-first** — 90%+ of traffic will be mobile via WhatsApp links. Max content width ~480px. Everything must be thumb-friendly.
- **Gentle WhatsApp transition** — Users arrive from a chat app. Background tone and feel should not create visual shock.
- **Single-column layout** — No side-by-side grids on mobile. Stack everything.
- **Sport-coded colour accents** — Each sport gets a gradient bar/pill (blue/violet for Soccer, red/orange for F1, green for GAA, amber for NBA, etc.)
- **Cards with gradient top bars** — 3-4px gradient accent at top of each event card, colour-coded to the sport.
- **Personality without clutter** — Fun facts and callouts should add warmth but not overwhelm the prediction interface.
- **Clean sans-serif typography** — Inter / system-ui throughout. No monospace spam, no serifs. Numbers can be slightly heavier weight.

## 5. Colour Palette

The palette balances a warm, approachable feel with enough contrast for data visualisation. Background tone is still being refined — should feel natural coming from WhatsApp (neither stark white nor pitch black).

| Role            | Colour                  | Hex               | Usage                                             |
|-----------------|-------------------------|-------------------|---------------------------------------------------|
| Primary Accent  | Amber / Gold            | #f59e0b           | CTAs, highlights, selected states, callout labels |
| Secondary       | Blue                    | #3b82f6           | Links, Soccer sport accent, info states           |
| Tertiary        | Violet                  | #8b5cf6           | Soccer gradient end, insights section, badges     |
| Success         | Green                   | #059669 / #00a884 | Correct predictions, win streaks, live indicators |
| Error           | Red / Rose              | #dc2626 / #f43f5e | Wrong predictions, loss streaks                   |
| Partial         | Amber                   | #f59e0b           | Partial credit predictions                        |
| Text Primary    | Near-black / Near-white | Varies            | Depends on background mode                        |
| Text Secondary  | Slate                   | #64748b / #8696a0 | Labels, captions, metadata                        |
| Card Background | White or dark card      | #ffffff / #1b2830 | Depends on background mode                        |

### Sport-Specific Gradients

| Sport     | From             | To                   | Pill Background      |
|-----------|------------------|----------------------|----------------------|
| Soccer    | #2563eb (Blue)   | #7c3aed (Violet)     | Blue @ 10% opacity   |
| Formula 1 | #dc2626 (Red)    | #ea580c (Orange)     | Red @ 10% opacity    |
| GAA       | #059669 (Green)  | #047857 (Dark Green) | Green @ 10% opacity  |
| NBA       | #d97706 (Amber)  | #dc2626 (Red)        | Amber @ 10% opacity  |
| Golf      | #4f46e5 (Indigo) | #7c3aed (Violet)     | Indigo @ 10% opacity |

## 6. Typography

Clean, modern sans-serif throughout. No monospace overuse, no serifs. The user explicitly rejected heavy monospace (Concept 5) and serif/slab (Concept 6) fonts.

| Element        | Font              | Weight      | Size (mobile) | Notes                                            |
|----------------|-------------------|-------------|---------------|--------------------------------------------------|
| Page Title     | Inter / system-ui | 300 (light) | 1.5rem        | Uppercase, letter-spacing 0.06em                 |
| Brand Accent   | Inter / system-ui | 700 (bold)  | 1.5rem        | Amber colour, used for 'Sport' in 'PredictSport' |
| Section Header | Inter / system-ui | 700         | 0.72rem       | Uppercase, letter-spacing 0.12em, muted colour   |
| Event Title    | Inter / system-ui | 700         | 0.95rem       | Normal case, primary text colour                 |
| Body / Labels  | Inter / system-ui | 400-600     | 0.72-0.82rem  | Secondary text colour                            |
| Stats / Points | Inter / system-ui | 800         | 1-2rem        | Accent colour, used for emphasis                 |
| Captions       | Inter / system-ui | 400         | 0.58-0.65rem  | Muted colour, uppercase for labels               |

## 7. Component Patterns

### Event Card

- 3-4px gradient top bar (sport-coded)
- Sport pill badge (icon + sport name, tinted background)
- Event title + league subtitle
- Countdown badge (amber tint, time to lock)
- Persona callout (fun fact with participant's custom label)
- Community prediction donut chart ('What the lads picked')
- Pick buttons (selected = amber border + tinted bg, others = subtle border)
- Rounded corners (14px), card background, subtle border

### Result Card

- Same structure as Event Card
- Points badge in top-right (green gradient if correct, red if wrong)
- Result row (grey background strip showing result vs your pick)
- Verdict quip — personalised ('Well played' or 'Ah sure look...')
- Check/cross icon in semantic colour

### Leaderboard — Podium Cards

- Horizontal row layout on mobile (not 3-column grid)
- Gradient background (1st: blue→violet, 2nd: slate, 3rd: bronze)
- Medal emoji, avatar circle, name, points in accent colour
- Form badges (W/L/P in semantic colours)
- Fun fact in italics, muted colour

### Leaderboard — Table Rows

- Rank number, avatar circle, name, form badges
- Accuracy ring (conic-gradient donut, 36-44px)
- Points (bold, right-aligned)
- Movement badge (+N green, -N red, -- neutral)

### Sport Pill

- Rounded capsule (border-radius: 20px)
- Sport emoji + uppercase sport name
- Tinted background matching sport gradient, darker text

### Form Badge

- 22x22px rounded square (border-radius: 6px)
- W = green bg, L = red bg, P = amber bg (all at ~10% opacity)
- Bold letter centred, semantic colour

## **Progress Bar**

- 5-6px height, rounded, background = border colour
- Fill = gradient matching the accent (e.g. amber→amberLight for round progress)

## **Section Header**

- 4px wide, 20px tall colour bar (accent-coded per section)
- Uppercase label, letter-spacing, muted colour

## **Persona Callout**

- Left border accent (3px, amber)
- Tinted background (amber at 8-10% opacity)
- Custom label in bold uppercase (per-participant, see Section 9)
- Fun fact text in italic

## 8. Prediction Types & Scoring

All six prediction types are in scope for MVP. The admin selects which type(s) apply when creating each event. Scoring is configurable per competition.

| Type              | Example                        | UI Pattern                        |
|-------------------|--------------------------------|-----------------------------------|
| Winner            | Who wins Liverpool vs Arsenal? | Button group (Home / Draw / Away) |
| Top N Finish      | Top 5 at The Masters?          | Player search + select            |
| Head to Head      | Verstappen vs Hamilton?        | Binary toggle (A or B)            |
| Margin of Victory | Ireland win by 1-7 points?     | Range selector / button group     |
| Over / Under      | Over 2.5 goals?                | Binary toggle (Over / Under)      |
| Beat the Handicap | Leinster -12.5?                | Binary toggle (Covers / Doesn't)  |

### Scoring Presets

- **Classic Quiz** — 10pts correct, 20pts dual questions, 10pts partial (mirrors paper format)
- **Tournament** — 10pts winner, 5pts top 5, 3pts top 10
- **Weekly Fixtures** — 3pts correct result, 1pt correct draw
- **Head to Head Series** — 5pts per correct H2H, bonus for clean sweep
- **Custom** — Admin defines everything

Tiebreaker: One numeric prediction per competition (e.g. 'Total goals in the World Cup'). Closest to actual value wins. No negative points.

## 9. Personality & Customisation

The group has strong personalities and banter. The app should reflect this. But casual users shouldn't be overwhelmed by configuration options.

### Per-Participant Persona Callouts

Each event card shows a fun fact with a personalised callout label. Instead of a generic 'The Gaffer Says...', each participant has their own label that rotates across events. Examples from the group:

- *"Parker's fantasy nous notes..."*
- *"Paddy Spoilsport Wind-up Merchant Nolan will have you know..."*
- *"Jay's suss..."*
- *"Tommo's taxi-rank wisdom..."*
- *"Robbo's gut feeling..."*
- *"Nidge, the hurling oracle, declares..."*

### Configuration Philosophy

- **Default:** If no custom callout is set, use '{Name} reckons...'
- **Where to configure:** Competition settings → Members → Edit callout label
- **Principle:** Deep customisation available but hidden well away. It should never block the core prediction flow.
- **Other customisable elements (future):** Avatar/photo, notification preferences, favourite sport, display name

### Tone of Voice

- Playful Irish humour — 'Ah sure look...', 'Well played', 'The craic is always free'
- Verdict quips on results — personalised per correct/wrong
- Rivalry callouts on leaderboard — 'Going to the wire — Ger trails Davo by just 3 points'
- Section names with character — 'The Back Page', 'Intel Report', 'The Table'
- Never corporate, never generic. This is a pub quiz, not a Bloomberg terminal.

# 10. Sports Data & Providers

The app uses a provider abstraction to fetch fixtures and results. Multiple providers can cover the same sport — first non-null result wins.

| Provider          | Sports                                                   | Cost            |
|-------------------|----------------------------------------------------------|-----------------|
| ESPN (unofficial) | NFL, NHL, NBA, MLB, Soccer, Rugby, Golf, Tennis, Snooker | Free            |
| TheSportsDB       | Soccer, Golf, Rugby, Tennis                              | Free            |
| API-Football      | Soccer                                                   | Free (4/hr cap) |
| OpenF1            | Formula 1                                                | Free            |
| BallDontLie       | NBA (+paid: NFL, MLB, NHL)                               | Free NBA        |
| MLB Stats         | MLB                                                      | Free            |
| Foireann          | GAA                                                      | Free            |
| TheRacingAPI      | Horse Racing                                             | Free tier       |
| Manual            | All (fallback)                                           | N/A             |

Design implication: The event creation flow needs a sport-aware fixture search. Admin picks a sport, searches for an event, and the app finds it across providers. Results can be auto-fetched and confirmed with one click.

## 11. Notifications (WhatsApp)

WhatsApp Cloud API (official Meta API). Free tier: 1,000 service conversations/month. Users opt in by messaging the bot first (WhatsApp policy).

### Notification Types

- **Competition invite** — 'New competition created — join here: [link]'
- **Lock reminder** — '[Event] locks in 24 hours — submit your prediction!'
- **Result confirmed** — 'Result: [Event] — [Answer]. Leaderboard updated!'
- **Leaderboard summary** — Weekly/monthly standings
- **Nomination review** — 'New event nominated by [User] — review it' (admin only)

Design consideration: Notification messages should include a deep link back to the specific event or leaderboard page. The landing page from a notification should be immediately useful — no extra taps to find the relevant content.

## 12. Technical Constraints

- **Framework:** Next.js 16 (App Router) + TypeScript strict + Tailwind CSS 4
- **Database:** Supabase (PostgreSQL + Auth + RLS). No ORM.
- **Hosting:** Vercel (free tier) + Supabase (free tier)
- **Auth:** Google OAuth via Supabase @supabase/ssr cookie sessions
- **No native app:** Mobile web only (PWA potential later)
- **Deployed:** predictsport-rust.vercel.app (auto-deploys from master)
- **Design system:** Not yet established — this brief is the starting point
- **Component library:** None yet — open to recommendation (shadcn/ui, Radix, etc.)
- **Animation:** Keep lightweight — no heavy animation libraries. CSS transitions preferred.
- **Images:** Minimal — sport emojis and SVG icons preferred over raster images
- **Offline:** Not required for MVP

---

*Questions? The 7 design concept pages are available at /designs/1 through /designs/7, and the hybrid at /designs/8. The deployed prototype is at predictsport-rust.vercel.app. All specs are in the /docs directory of the repository.*
